

## Sync-Products-Integration

In this poc i need to sync the products coming from the request in the database and in the salesforce The objective of this project is to design and implement a MuleSoft integration flow that automates the process of fetching, transforming, and synchronizing product data across multiple systems.

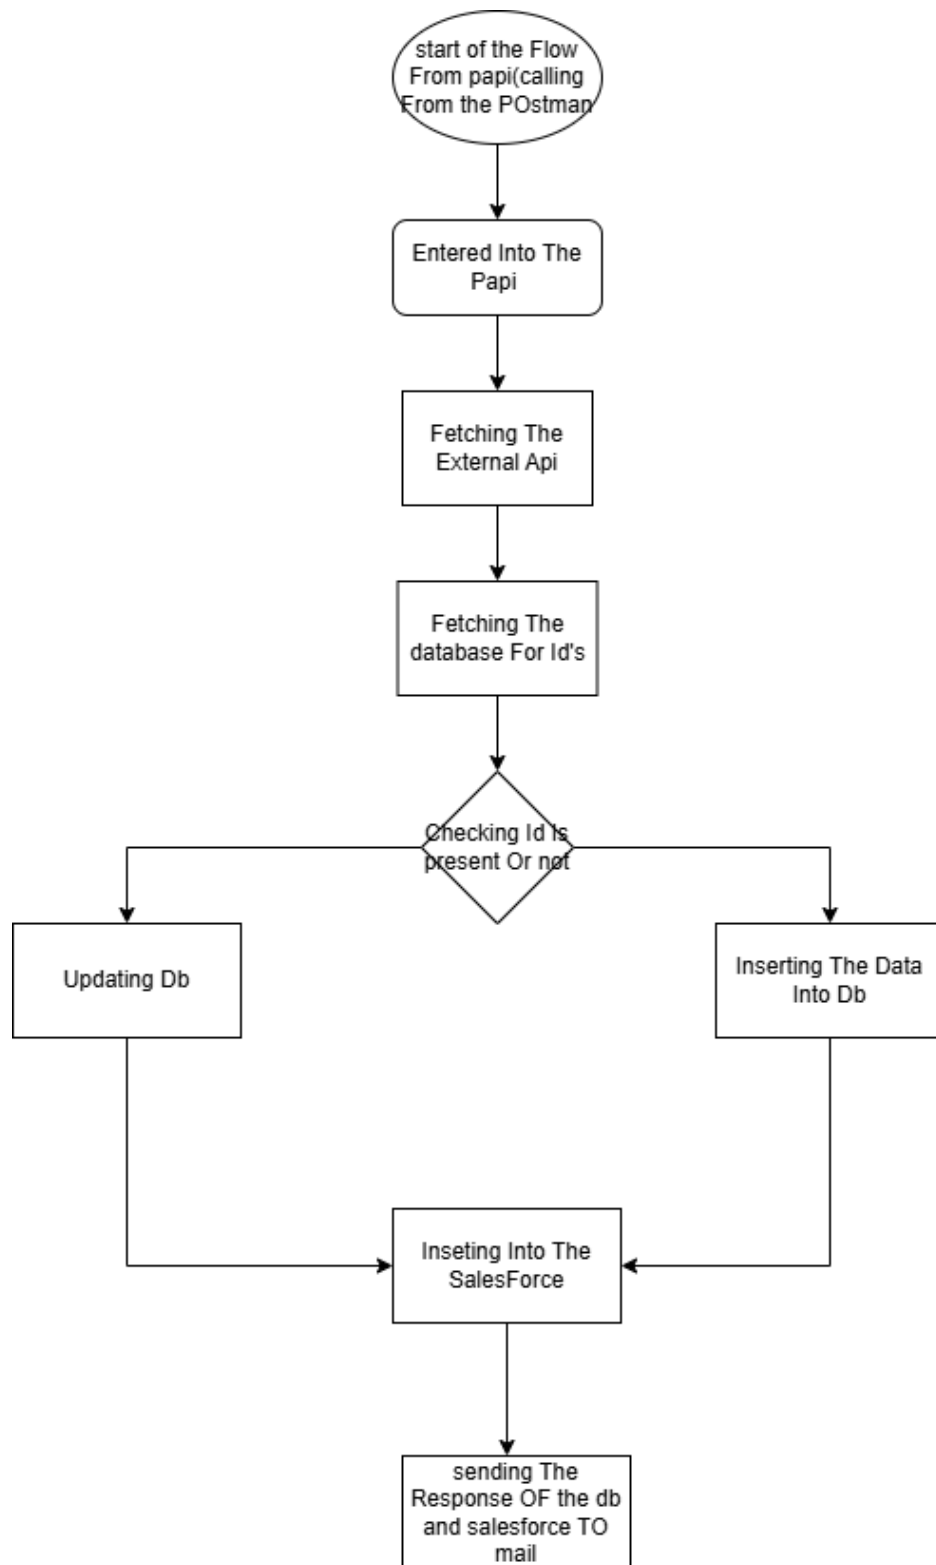

The integration performs the following key functions:

1. **Fetches product data** from an external public API.
2. **Transforms the incoming JSON data** into the required structure using DataWeave.
3. **Inserts the transformed data** into both a **local database** and **Salesforce** for synchronization.
4. Implements **comprehensive logging** and **error handling** to ensure smooth execution and maintain traceability.
5. **Sends an email notification** after successful data insertion in both systems.
6. Includes **detailed documentation** and **MUnit test cases** to validate the flow's functionality and reliability.

To do this project i created the 3 apis

1. Sync-products-integration-papi
2. Sync-products-integration-db-sapi
3. Sync-products-integration-sf-sapi

Project FLOW :

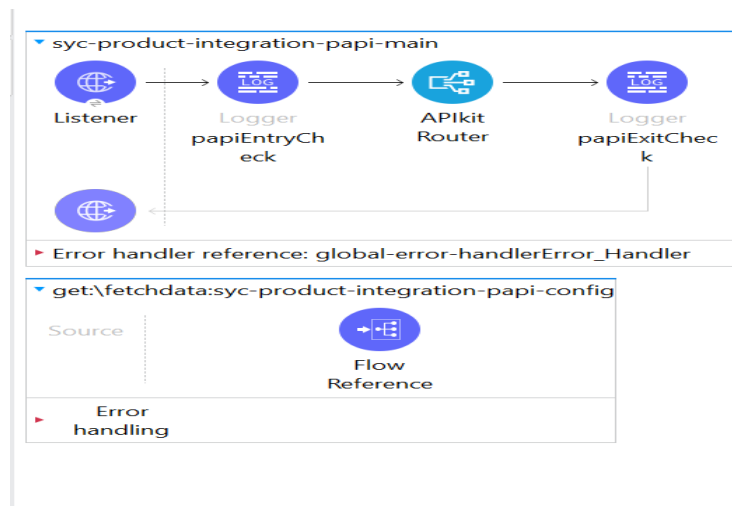

Process-api : sync-products-integration-papi

This is the process api where the entire logical operations are done . Here i used the 4 request . The first request is for the fetching the data , second request is fetching the ids, third request calling the database insert , fourth request is calling the database update fifth request is the calling the salesforce upsert

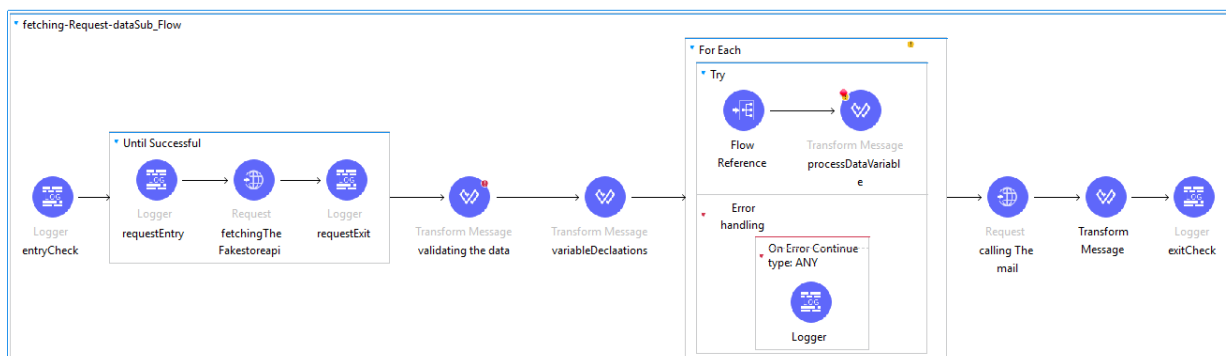

## Sync-product-integration-papi
